OPMANTEK CONTINUES STRONG GROWTH AND INCREASES PRESENCE IN THE NETWORK AUTOMATION MARKET WITH NEW CONFIGURATION TECHNOLOGY

Monday, 27th June 2016

Opmantek has continued its strong customer acquisition and revenue growth fuelled by the release of new and innovative technologies.

This month, the company released a new configuration 'push' technology that allows IT operations staff and organizations to go beyond the monitoring of configuration changes to writing changes in an interactive manner based on what the software observes is happening – reducing the need for human interaction and increasing the ability to maintain, monitor and execute compliance policies in an enterprise network – this is very important in IoT (Internet of Things) and BYoD (Bring Your own Device) environments.

Earlier this year Opmantek was recognised by Gartner as a leading solution in the 2016 Market Guide for Network Automation and this latest development in technology provides a further advancement into this evolving market.

On the world stage, Opmantek software continues to be recognized for its cutting edge technologies and modern business approach. Opmantek CEO, Danny Maher was in New York this month to receive an award for 'The Most Innovative Company – Up to 100 Employees' at the American Business Awards and commented "Opmantek has one of the leading team of innovators on the planet led by our product founders, Keith Sinclair and Mark Unwin - I'm thrilled that they have been recognized in this manner."
